

Climate change and the marine environment

By Sorchá

What is climate change

- Climate change means the climate in a country or region has change for the worst
- To say the climate has change in your country it must be different from the usual climate for at least 30 years

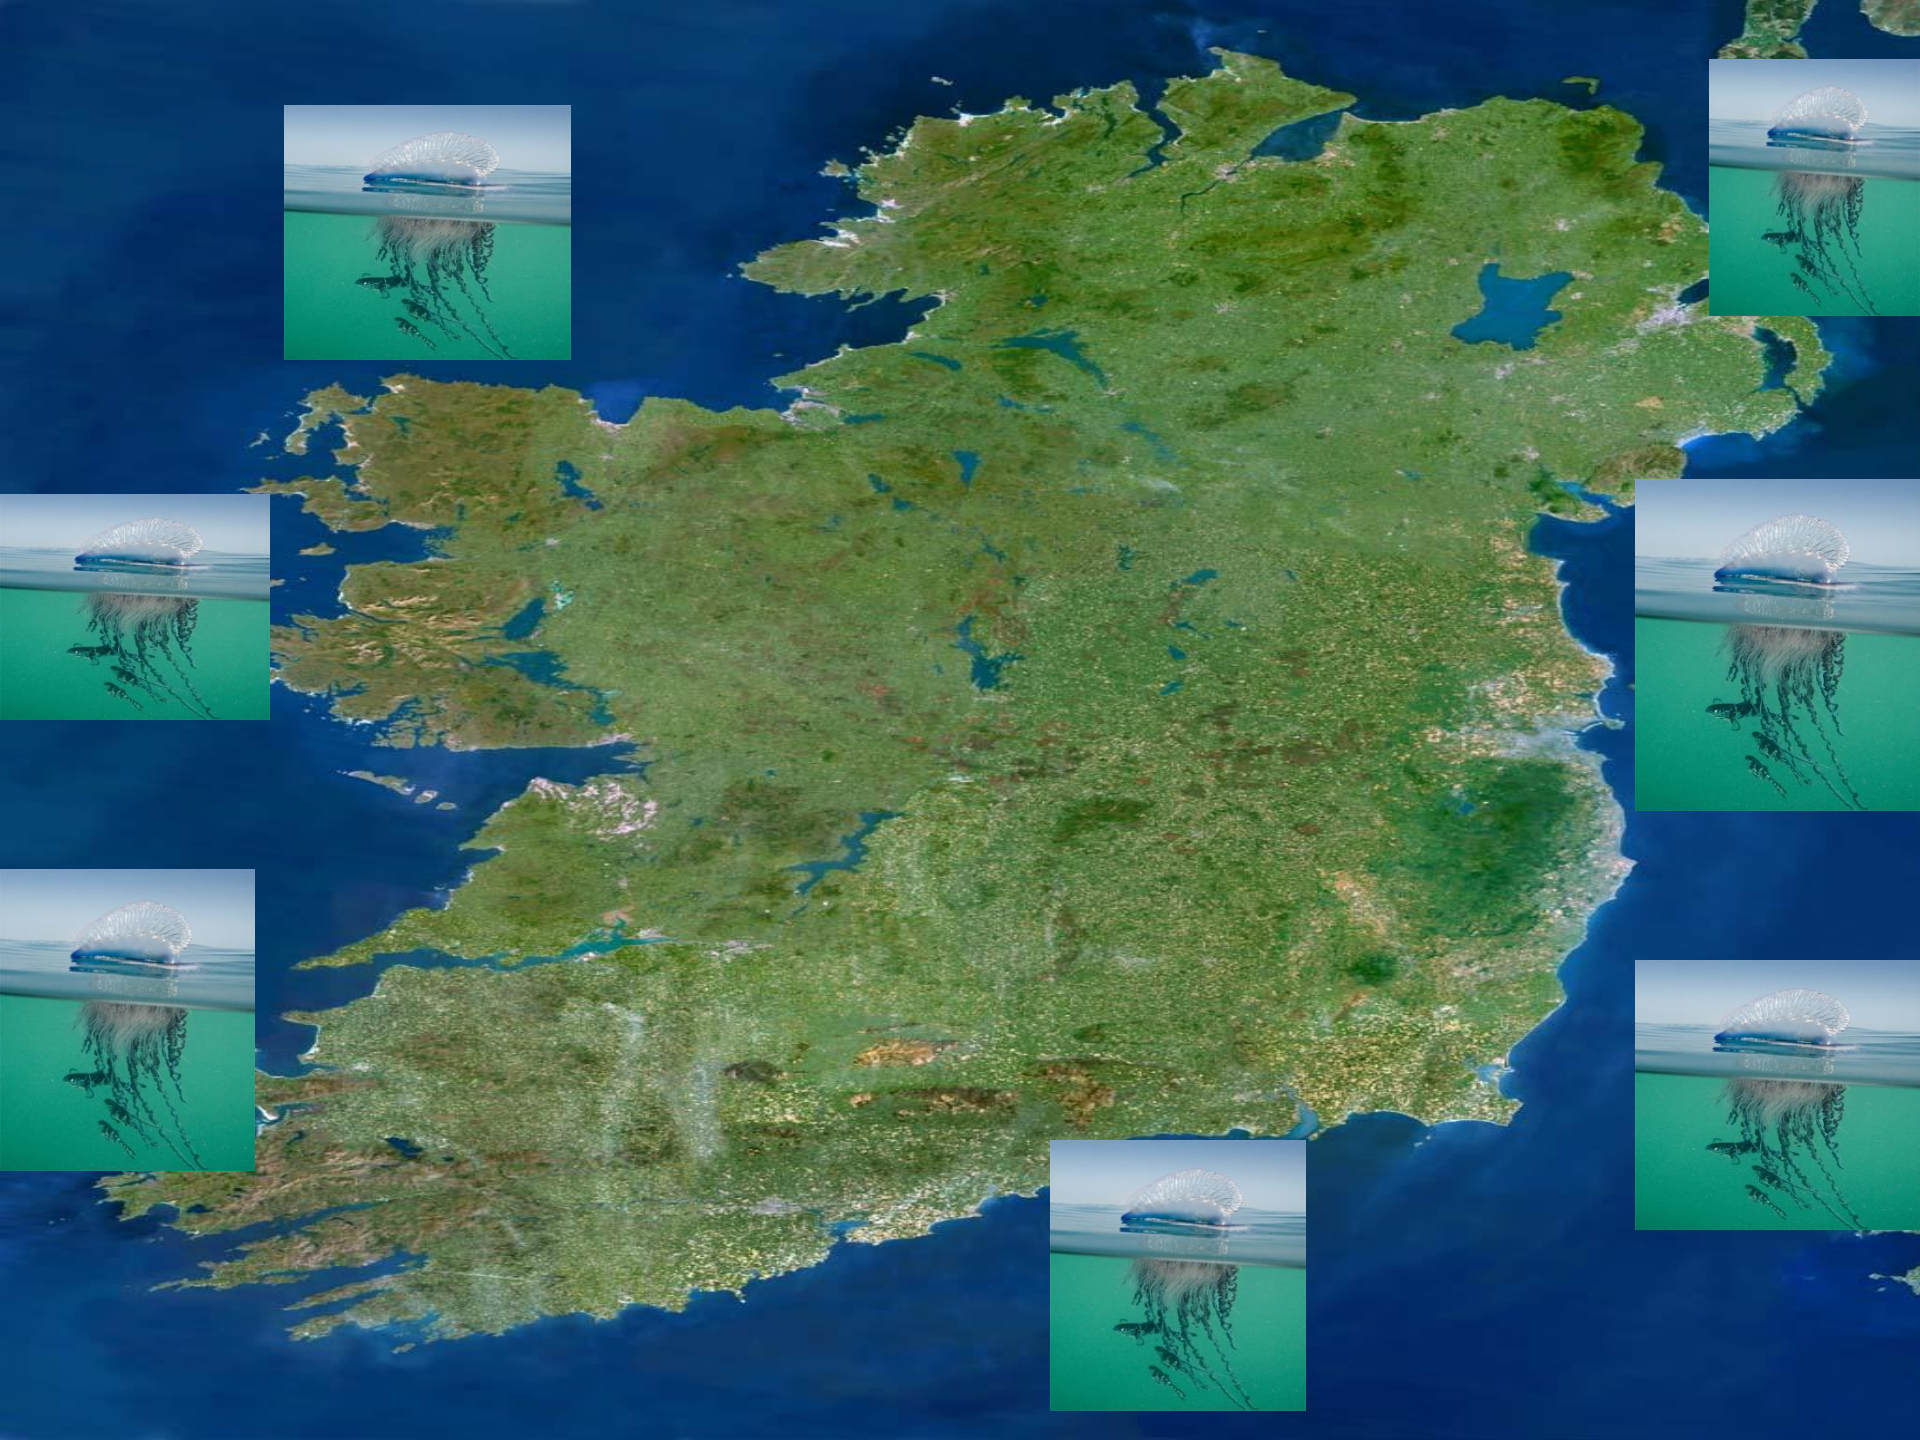

Water

- We are the cause of climate change because we are abusing the earth's resources
- Every time we leave the tap on we are wasting water. that could be used by people that need it

What is the effect of climate change

- One of the biggest effects of climate in Ireland is we are seeing lots of new species on your coast
- Like the Portuguese man o war which is a deadly breed of jell fish

Pollution

- Many fish are dying out like plankton due to the water getting warmer and more acidic
- By 2050 there will be more plastic bags in the sea than fish

How we can help

- We can by walking and cycling to work and school and taking public transport instead of taking the car
- We could all do a 2 minute beach clean up too.
